LEAD PLATFORM & DEVELOPER EXPERIENCE (DEVEX) ENGINEER

SUMMARY

A successful internal developer platform does more than provision infrastructure—it transforms the way engineering organizations build, deploy, and operate software. I approach platform engineering as product engineering, combining systems architecture, developer experience, and operational excellence to create platforms that make the secure, reliable path the easiest path.

I've spent my career turning fragmented infrastructure and manual operational processes into cohesive, self-service engineering ecosystems. At adMarketplace, I helped transform a complex hybrid environment into a Kubernetes-native platform, building developer portals, automated provisioning workflows, and standardized delivery patterns that empowered 100+ engineers to operate infrastructure with greater autonomy. By bringing infrastructure, CI/CD, and GitOps together, I helped establish a consistent engineering experience across hundreds of microservices and modernize delivery pipelines spanning more than 900 repositories.

My philosophy is to engineer away friction without engineering away control. I build golden paths that accelerate delivery while embedding security, policy enforcement, observability, and cost governance into the platform itself. Rather than treating these capabilities as separate operational responsibilities, I integrate them into the developer workflow—making reliability, compliance, and efficiency natural outcomes of good engineering.

I measure platform success by its impact on the people and systems it serves: less cognitive overhead, faster feedback, greater developer autonomy, and lower operational costs. That approach has helped me drive company-wide cloud cost reductions of 50%, standardize enterprise observability, and introduce secure AI-assisted engineering workflows.

I bring the perspective of both a systems engineer who understands what happens beneath the abstractions and a platform architect who understands why those abstractions matter to developers and the business.

My goal is simple: build platforms that make engineering teams faster, systems more resilient, and operational complexity progressively less visible.

SKILLS

- **Platform as a Product & DevEx Leadership:** Internal Developer Portals (IDPs), Golden Path Templates, Boilerplate Service Scaffolding, Developer Velocity & DORA Metrics, Engineering Team Leadership (15+ Engineers), Scrum Master, Architecture Review Board, Developer Self-Service, SDLC Automation
- **GitOps & SDLC Automation:** ArgoCD, Argo Workflows, GitHub Actions, Crossplane, Terraform (Declarative IaC), Kubernetes-Native CI/CD Pipelines, Multi-Account Deployment Automation
- **Cloud & Container Orchestration:** AWS (Multi-Account / Multi-Region EKS), Kubernetes Topology Architecture, Helm, Karpenter Autoscaling, Service Mesh, Hybrid Cloud Platforms
- **DevSecOps & Enterprise Governance:** Snyk, SonarQube, JFrog Artifactory, Automated SBOM Generation, SOC 2 Audit Compliance, Guardrailed Self-Service Provisioning, ,
- **SRE & Full-Stack Observability:** Datadog APM, OpenTelemetry, PagerDuty, Distributed Tracing, Incident Management & Post-Mortems, Zero-Downtime Operations, MTTR Optimization, Prometheus, ELK
- **FinOps & Developer AI Tooling:** Karpenter Dynamic Autoscaling, AWS Spot Instance Strategies, Kubecost Cost-Allocation, Enterprise LLM Proxy Gateways (Claude Code, GitHub Copilot), PII Sanitization

EXPERIENCE

adMarketplace | New York, NY Lead Platform & Infrastructure Engineer | Oct 2016 – May 2026

Led company-wide platform engineering, developer experience (DevEx), SRE, and cloud infrastructure initiatives. Hired and managed cross-functional teams of 15+ platform and DevOps engineers, served on the Architecture Review Board, acted as Scrum Master, and maintained direct FinOps budget ownership for all cloud infrastructure.

- **Internal Developer Portals & Golden Path Templates:** Abstracted multi-account AWS EKS and hybrid cloud topologies into self-service Internal Developer Portals (IDPs) and standardized golden path templates—empowering 100+ product engineers across 1,500+ workflows to scaffold, test, and deploy microservices autonomously without ops tickets.
- **GitOps Migration & SDLC Acceleration:** Spearheaded the company-wide migration of 600+ microservices and 900+ repositories from legacy batch schedulers (Jenkins, Airflow, Hadoop) to Kubernetes-native GitOps pipelines using ArgoCD, Argo Workflows, and GitHub Actions, drastically cutting code-to-production cycle times.
- **Engineering Management & Agile Governance:** Hired, built, and mentored platform and DevOps engineering teams (15+ engineers). Served as Scrum Master and active member of the Architecture Review Board to establish engineering career ladders, define platform design patterns, and eliminate operational toil across product teams.
- **DevSecOps & Automated Compliance:** Embedded automated security scanning (Snyk, SonarQube, JFrog Artifactory) directly into CI/CD delivery pipelines, implementing SOC 2 compliance controls and automated SBOM generation seamlessly into developer workflows without slowing down deployments.
- **Enterprise AI Tooling & Guardrailed Adoption:** Architected and operated centralized LLM proxy gateways equipped with automated PII sanitization scripts, enabling safe, enterprise-wide adoption of AI-assisted developer tools (Claude Code, GitHub Copilot) across all engineering teams.
- **FinOps & Cloud Cost Optimization:** Held direct budget ownership for multi-million dollar cloud operations; reduced enterprise AWS cluster spend by **50% (\$600K+ in annualized OpEx savings)** by implementing Karpenter dynamic autoscaling, aggressive spot instance strategies, and Kubecost resource allocation.
- **Full-Stack Observability & SRE Reliability:** Replaced fragmented legacy monitoring systems with a unified Datadog APM, OpenTelemetry, and PagerDuty stack—providing engineering teams with real-time distributed tracing, automated alerting, and clear DORA metric visibility to accelerate root-cause analysis.
- **High-Throughput Core Infrastructure:** Managed high-throughput Amazon MSK (Apache Kafka) data streaming clusters (2B+ daily events, 500+ GB/day) and Vespa Cloud hybrid vector search platforms (sub-20ms search at 15,000+ QPS), supplying resilient, low-latency infrastructure dependencies for product engineering teams.

EDUCATION & CERTIFICATIONS

- **New York Institute of Technology** — B.S. in Computer Science
- **Certification:** AWS Certified Cloud Practitioner
